

AfriKelp[®] Plus

Nature in balance

A specialist blend of trace elements for soil and leaf applications which contains Seaweed Extract (*Ecklonia maxima*) and high levels of magnesium.

DESCRIPTION

Afrikelp plus is specifically blended to help the plant convert nitrogen into functional protein and to improve photosynthesis. The net result of this is a plant that has higher energy levels which improves the root system and helps the plant overcome disease and abiotic stress factors. The product works extremely well in seedlings and improves fruit set in tree crops like Macadamias.

TYPICAL SOIL APPLICATION RATES PER HA:

5-10l/ha at planting on row crops.

2.5% drench on seedlings.

20-40l for tree crops like Macadamias and Avocado.

(A typical dilution rate for soil applications is 5% OR it can be applied via the irrigation system)

TYPICAL FOLIAR APPLICATIONS:

2-10l per ha (0.5-2.5% conc) applied at germination, on new flush or flowering. Do not mix with other products without technical advice.
