Peter Goede of BioBoer joins Pepperfresh

New partnership with BioBoer

BioBoer ("Biofarmer" in English) is a company started in 2003 by **Peter Goede**.

Peter specializes in sub-tropical tree crops and has an 8 year history with the founding members of Pepperfresh. He has always represented the biological voice in discussing solutions for the farmers. His experience is extensive in the application of compost, lime and related products and he is now using this knowledge together with comprehensive data from the AgIQ platform to help achieve our vision of improving African Agriculture. We see a very exciting "fruit" from this merger of the two entities.

"The merge between BioBoer and Pepperfresh means a focused approach towards our aim: cost-effective solutions for fertilizer use efficiency, healthier crops needing less chemicals, and better yields of best quality for the farmer. To roll out the proven success of the Pepperfresh business model in South Africa is exciting for both parties and to the benefit of the client."

- Peter Goede

Pepperfresh appointed as Specialist Agronomist for Universal Mozambique

Pepperfresh was invited to present their new precision software ([AglQ](#)) to Universal at the end of 2018 and after this Universal showed interest in using Pepperfresh to help improve the nutrient management program for the extensive small scale operation in Mozambique.

Pepperfresh has delivered the first report and has clearly demonstrated that due to the focus on fertilizer efficiency and data based decisions Universal will be able to make significant improvements to their nutrient management programs.

NewAg International Conference 2019 Dublin

Pepperfresh is committed to world class products and service and with that in mind we, and Thinus Enslin of [AgriPrecise](#), attended and presented at the New Ag international conference in Dublin to gain more international exposure and information with regards to our business.

We presented a paper on the use of precision data to refine soil norms for wheat production in the Mkushi area of Zambia. The data was collected from the Silverlands farm in Kakushi. They have been our customer for 4 years and we now have developed a system whereby we use their own yield data to fine tune the fertilizer program. We would like to achieve this in a similar way with our tobacco customers using our unique approach in the [AglQ software](#).

Latest Research + News

The nutrient management of small scale tobacco farming systems poses new challenges with regards to the delivery, application and the efficacy of the products being used to address the nutrient requirements of tobacco, the soil nutrient status and the general impact on the environment.

The challenge with the delivery and application of normal lime opened the door for new products to address soil acidity and this led to the introduction of CalSap (www.optimaagriculture.com.au) by Pepperfresh which has resulted in...
